A photograph of a person walking away from the camera on a dirt path through a dense, lush green forest. The person is wearing a light-colored top and a patterned skirt, and is holding a bright pink umbrella. Sunlight filters through the trees, creating dappled light on the path. The text is overlaid on the upper half of the image.

SOIL SURVEYS SOIL CLASSIFICATION & MAPPING

SOIL DESCRIPTION

HORIZONS

- Depth
- Colour
- Texture
- Consistency
- Structure
- Coarse fragments
- Mottles
- Cutans
- Permeability
- transition

Master Horizons

A horizon

E horizon

B horizon

Soil colour
use
MUNSELL
soil colour
charts

texture

e.g

Clay=35%

Silt=36%

Sand=29%

=clay loam

structure

- Crumb
- Blocky
- Prismatic
- platy
- columnar

Crumb structure

Strong blocky to prismatic structure in a vertic soil

consistency

1 =soft /Very friable to friable

2=slightly firm

3= hard/firm

4=very hard/very firm

5= extremely hard

mottles

Rusty mottles

Caused by redox conditions

Reduction and oxidation

Transition

Gradual

Clear
abrupt

SOIL CHARACTERISTICS USED TO DETERMINE

- Effective rooting depth (ERD or ESD)
- Soil water holding capacity
- Drainage
- Water infiltration
- Erosion hazard
- Compaction hazard

COMPACTION

Caused by:

- Heavy machinery
- Wind
- Animals e.g. cattle, horses, sheep
- People

Soil compaction amelioration

- Ripping with single tine or single winged tine to 1 m
- Single rip line
- Cross rip

Ripping is done when soil is dry to shatter massive soil structure and to prevent soil smearing

Duplex sodic soil Sterkspruit form

Dispersive; highly
prone to erosion

Topsoil loss on sodic duplex soil

ERD

Gmelina arborea

Most rooting in A horizon

Rooting of *Jatropha curcus* due to depth restrictions

Boophone disticha

SOIL CLASSIFICATION

- FAO (WRB)

SOIL FORM

Based on DIAGNOSTIC horizons:

Orthic A

E

Gley B

=Kroonstad form

MAGWA form

Humic A

Yellow-brown apedal B

INANDA form

Humic A

Red apedal B

SWEETWATER form

HUMIC A

NEOCUTANIC B

Fernwood form

Orthic A

E horizon

Unspecified

Organic O horizon
> 10% organic carbon

Bonheim Form

Melanic A

Pedocutanic B

SOIL FAMILY

- Based on various characteristics such as:
- How thick is A horizon
- How hard is B horizon
- How wet is B horizon
- Luvic – non-luvic

e.g **Magwa 1100**

SOIL FAMILIES

1000	Humic A horizon thin		
	Non-luvic B1 horizon	1100	GLENESK
	Luvic B1 horizon	1200	CONNEMARA
2000	Humic A horizon thick		
	Non-luvic B1 horizon	2100	LAMBASI
	Luvic B1 horizon	2200	NTSUBANE

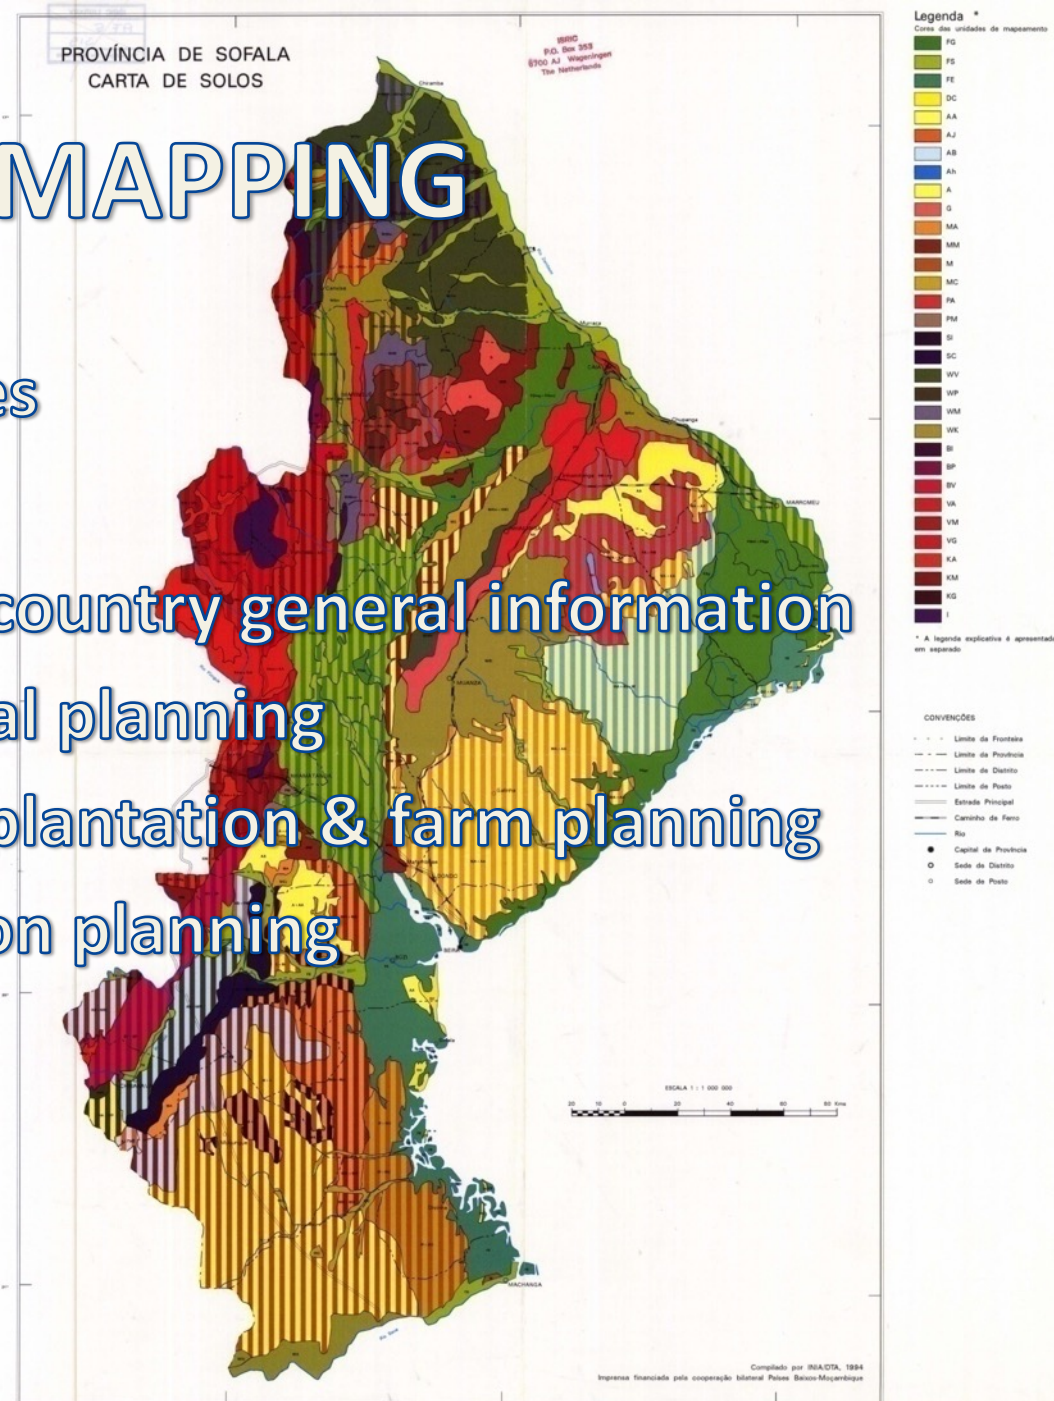

Note

The colour of the yellow-brown apedal B horizon in the example with a thin humic A horizon is 10YR 3/4 (moist) and 10YR 4/4 (dry); the yellow-brown apedal B horizon merges to feldspathic Beaufort sandstone saprolite.

SOIL MAPPING

Common Mapping scales

- 1:1 000 000 Whole country general information
- 1:50 000 Regional planning
- 1:10 000 Forest plantation & farm planning
- 1:5 000 Irrigation planning

Soil data collection

- Soil auger and/or soil pits
- Free survey
- Grid survey

Reconnaissance 300 to 500 m espacement

Dryland crops & forestry 150x 150 m grid

Irrigated crops 50 x 50 m grid

From each soil auger the following data is collected:

Soil obs data
